How a heat pump works

Why?	 wide range of outside temperatures high temperature parameters of the heating system high temperature parameters of the domestic hot water
For whom?	 for anyone building a house for those replacing or retrofitting an existing heat source suitable for single-family, multifamily and commercial buildings
Benefits	 ✓ zero-emission energy production ✓ safety of use ✓ maintenance-free and reliable unit

Heat pump: a renewable energy source

The heat pump draws free energy from the air and uses it to heat and cool the building, or prepare domestic hot water. It is a cheap, ecological and reliable heat source, which can be used by anyone.

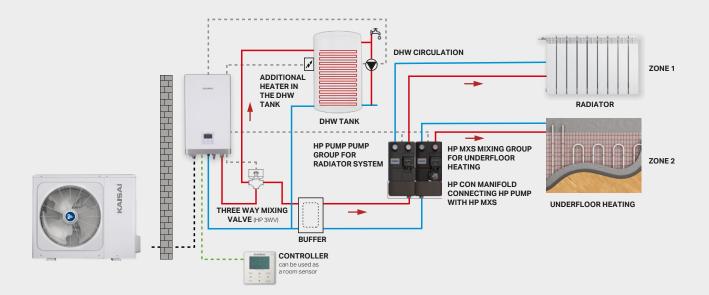

Thanks to cutting-edge technology, Kaisai heat pumps operate in a wide range of outside temperatures and achieve the high temperature parameters of the heating system or domestic hot water. No emission of harmful substances into the environment, operational safety, and maintenance-free make the Kaisai heat pumps an ideal solution for everyone who builds a house as well as replaces or retrofits the current heat source. The Kaisai heat pumps can be used in single-family, multifamily, and commercial buildings.

Renewable energy sources (RES) are based on natural resources, the extraction of which ensures not only zero-emission energy production but also a wide range of possibilities for its use. Due to relatively easy access to technology and the possibility for it to be used by companies and individual households, the most popular solutions are the units which obtain energy from the air and the sun.

Kaisai's product range provides state-of-the-art RES solutions that include air-to-water heat pumps, heat recovery units, and photovoltaic modules and inverters.

Two heating circuits

Zoning provides greater control flexibility. Controlling two heating circuits allows more precise temperature control. Mixed heating, based on both radiators and underfloor heating, is still very popular. All Kaisai heat pumps come with a controller for mixing group operation as a standard. The heat pump controller controls the temperature of the radiator heating (or fan-coil units) and the underfloor heating independently. Ready-to-connect, quick to install and aesthetically pleasing mixing and pump groups are available as additional accessories.

ZONE 1 control based on leaving water temperature or heating curve **ZONE 2** control based on leaving water temperature, heating curve or room temperature

Split or monoblok

Split

SPLIT IS A SET OF: OUTDOOR UNIT AND INDOOR UNIT

The design of the device, consisting of an indoor and outdoor unit, requires specialist installation carried out by an installer qualified to work with refrigerant gases. The advantage of this solution is that there is no risk of the heating medium freezing in case of power failure. Unlike monoblock pumps, the unit outside the building uses non-freezing refrigerant.

NO RISK OF THE HEATING MEDIUM FREEZING

OUTDOOR UNIT REQUIRING LESS SPACE

EASIER ACCESS TO HYDRAULIC COMPONENTS

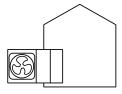

POSSIBLE INSTALLATION OF THE HYDRAULIC MODULE UP TO 30 M FROM THE OUTDOOR UNIT

6

MONOBLOCK CONSIST ONLY OF ONE OUTDOOR UNIT

It is a compact, easy to install solution, which saves space inside the building. The user receives a complete, hermetic, ready-to-operate device, which does not require installation of a cooling system and specialist inspections. This solution is related to the necessity of securing the heating medium (water) against freezing in case of power failure.

Prevalence of Monoblock

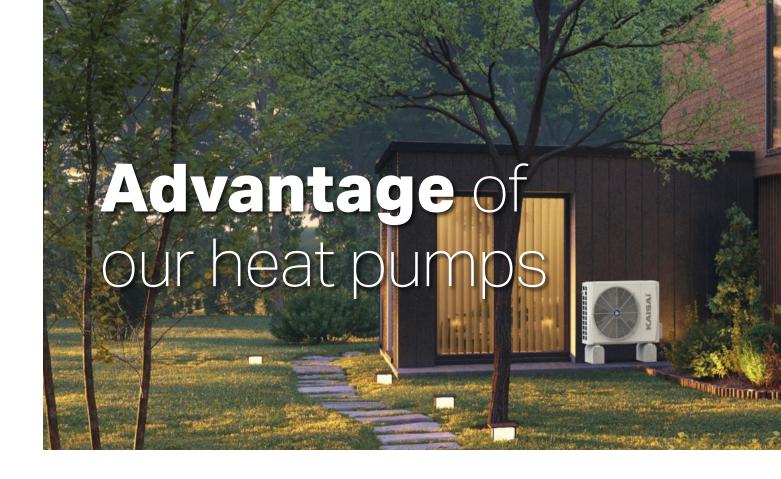

NO SPECIFIC F-GAS AUTHORISATIONS REQUIRED

SAVING OF SPACE INSIDE THE BUILDING DUE TO LACK OF HYDRAULIC MODULE

HYDRAULIC READINESS FOR INTEROPERATION WITH CENTRAL HEATING

SIMPLE INSTALLATION

Large selection of units and heating capacities

Kaisai's latest product range includes 14 heat pump models, including eight monoblock units (from 6 kW to 30 kW) and six split models (from 6 kW to 16 kW), for which six indoor units are provided with or without domestic water tank (190 l or 240 l).

- 23 different sets of devices, customisable to individual needs.
- When the required heating capacity exceeds 30 kW, the heat pumps can be combined into cascades (up to 6 units) for a total capacity of up to 180 kW.
- The use of Modbus communication makes it possible to connect up to 16 devices.
- Cascade connection and Modbus function come as standard, that is why no additional accessories are required for installation.

Additional equipment for heat pumps - more functions in the standard version

- The hydraulic system is equipped with a circulating pump, peak heat source, safety group, flow sensor, air vent and pressure gauge as standard.
- The split indoor unit with an integrated domestic hot water tank is a complete solution for heating, cooling and preparing DHW in one compact device.
- All outdoor units have a heated drip tray as standard and monoblock models have an additional structural frame.

Economical solutions with high parameters

The basic criteria for selecting a heat pump, both for retrofitted and newly erected facilities, are the functionality of the devices and their high operating parameters.

By using environmentally friendly R32 refrigerant and the highest quality components, Kaisai heat pumps have a very wide operating range: outside air temperature range from -25°C to 43°C and heating medium temperature of up to 65°C.

- Possibility of heating a house equipped with traditional radiators even at very low outside temperature (at -20°C outside, the heat pump reaches a temperature of 57°C of heating system water temperature)
- The highest energy class A+++
- Extremely high efficiency: COP of 5.20 (A7W35) and SCOP of 5.22 (LWT 35°C)
- Reduced noise level: from 45 dB (A) at a distance of 1 m

Ecological energy source

Environmentally-friendly refrigerant, available in the entire Kaisai range

Kaisai heat pumps currently use the latest green refrigerant — R32. It is more efficient than those previously used, that is why less refrigerant is required. Moreover, the refrigerant has much better factors of impact on the environment. It is a modern solution taking into account both ecological needs and economy of use.

Key features of the R32 refrigerant

ECOLOGICAL

R32 has one of the lowest GWP values available on the market – 675. It also does not cause damage to the ozone layer thanks to ODP value equal to 0. Compared to older solutions, it has as much as 75% less impact on global warming. What is more, it can also be recycled.

ECONOMIC

Compared to R410A, R32 is more energy-efficient, that is why less refrigerant is required by the cooling system and equipment efficiency is increased by up to 10%.

SAFE

R32 has low toxicity and is almost non-flammable - it does not pose a threat to life and health even in case of system leaks.

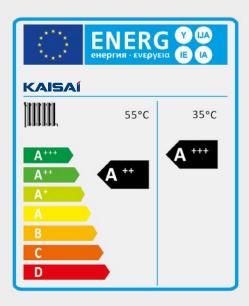

Refrigerant R32 VS R410A 759/6 less impact on global warming with R32

Energy efficiency class

Energy labels are placed on every domestic electrical appliance sold in the European Union. This is regulated by a special EU Directive 2010/30/EU. Labels inform the user about the quality of the product, taking into account, in particular, its energy efficiency. Before purchasing, the label allows everyone to compare which device will be the cheapest in terms of operation.

The ERP Directive indicates the highest possible rating for the Arctic product range.

ηs seasonal energy efficiency of room heating up to 206% ηs on average up to **A +++ at 35 ° C** ηs on average up to **A ++ at 55 ° C**

23°C 21°C

When the house is heated simultaneously with radiators and underfloor heating, the function allows the temperature to be precisely controlled separately for each of these heating circuits.

WIFI CONTROL AS STANDARD*

Kaisai products incorporate several features improving the comfort of use; for example, new control options have been added so that managing a heat pump has never been so convenient and simple.

- Remote control using an application on a smartphone
 or tablet
- Monitoring of current device status, zone switching, supply and domestic hot water temperature control
- Displaying error information
- Displaying current energy consumption

*BETA version of the software may not work on every device. Malfunction of the application does not constitute grounds for a complaint.

LOW NOISE LEVEL

Innovative design for lower noise level

The use of inverter compressors in outdoor units and the extremely quiet operation ensure full comfort when using the Kaisai heat pumps. The compact design of the outdoor unit with a single fan with high performance and lower noise level. The single fan design for the Mono 12~16 kW series reduces the sound power level Erp by 6 dB. In addition, the silent mode function with two levels of operation can be used when required.

HOLIDAY PROGRAMME

While away from home for a long time, there is no need to change the weekly schedule. In the "Holiday programme" mode you can, among other things, turn off DHW heating, disinfection at a preset time interval and lower the temperature in the building. A separate "Holidays at home" function allows the schedules to be paused for the duration of a long stay at home.

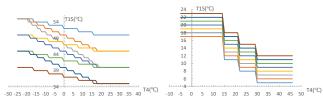

WEATHER -RESPONSIVE CONTROL

Climate curves

- The water temperature is set automatically based on the outside temperature.
- 32 weather temperature curves are set as standard. Custom curves are also available to meet varying temperature requirements.

Safety of use

HEATING AND DRYING THE FLOOR

Drying mode and preheating mode protect the floor from bulges and even cracking. In newly built buildings, this mode works well right after the floor has been poured, when there is a lot of water left on the floor.

DHW TANK DISINFECTION FUNCTION

By heating the water in the system to 70°C, the high temperature kills most bacteria (including Legionella).

Legionella bacteria die instantly
 90% of bacteria die within 2 minutes
 90% of bacteria die within 2 hours

Bacteria are active

Bacteria are active but not multiplying

The heat exchangers use aluminium fins covered with an additional hydrophilic coating. This significantly increases their resistance to weather conditions, resulting in longer service life and lower susceptibility to corrosion.

<u>....</u>

SAFETY OF USE

The task of the intelligent automation system is to protect the heat pump against damage. The use of special explosion-proof electronic systems maximises operational safety, allowing the stable use of ecological R32 refrigerant, which is not only particularly environmentally friendly but also more efficient under extreme conditions.

OPERATION OVERVIEW

This function provides the user with a view of the basic operating parameters of the device in real-time, which in case of an error allows for a quick reaction. There are 4 operating modes: cooling, heating, DHW and auto. To meet the different requirements of users, you can combine 3 modes.

Economic solutions

HIGH ENERGY EFFICIENCY

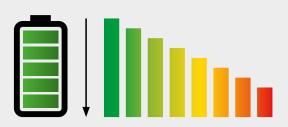

The heat pumps are equipped with energy-efficient inverter compressors that allow variable heating capacity adjustment. This increases the efficiency of the entire system and reduces the operating costs of the pump. Kaisai heat pumps have COP of up to 5.20. The higher the coefficient, the more heat can be generated using the same amount of electricity.

POWER LIMITATION FUNCTION

The user has 8 levels to select from depending on the maximum allowable operating current. All you need to do is change the setting on the wired controller. This allows the units to be adapted to a wider range of applications.

SMART GRID FUNCTION

The heat pump adapts its operation to different electric signals. The energy consumption of the system can be automatically adjusted according to peak and low power to reduce heating costs to the greatest extent possible. With this function, the pump switches on automatically to take advantage of a cheaper energy tariff or to store excess power from a photovoltaic system.

DHW mode on – tank temperature set to 70°C. The heater switches on automatically when the water temperature drops below 69°C.

Standard operation of the heat pump

Limited operation – the unit operates for a specified time and switches off.

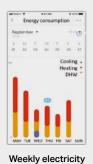

This function allows the user to analyse the heat pump's electricity consumption at different time intervals and optimise its settings to save even more in terms of heating costs.*

* BETA version of the software may not work on every device. Malfunction of the application does not constitute grounds for a complaint.

Modern technologies

INVERTER COMPRESSOR

The inverter technology in the Kaisai's units reduces power consumption, which is related to the reduction of room cooling and heating costs. Its use translates to the quiet operation of the unit and faster achievement of the desired temperature.

By using durable and high-pressure resistant materials, the compressor in Kaisai's heat pumps is extremely reliable. In addition, it has a high-efficiency motor with a wide voltage range, which is why it can operate in extreme conditions in 24-hour mode and reach temperatures of up to 65°C (voltage range from 172 to 265 V 50 Hz).

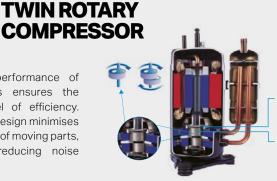

Better balance and extremely low vibrations:

- Double eccentric cams
- 2 balancing weights
- Optimisation of compressor drive technology:
- Extremely robust bearings
- Compact design

The high performance of compressors ensures the highest level of efficiency. The unique design minimises the vibration of moving parts, effectively reducing noise levels.

Highly efficient and quiet motors owe their characteristics to the sinusoidal control of the DC inverter. Structure optimisation provides 10% higher performance with a 35% reduction in size. Thanks to an energy-efficient motor, the units can use multiple fan speeds, which reduces energy consumption and the time needed to reach the set temperature. In turn, the use of modern technology allows for the reduction of noise levels.

USB FUNCTION

Quick setup and saving of device settings significantly shorten the heat pump setup process.

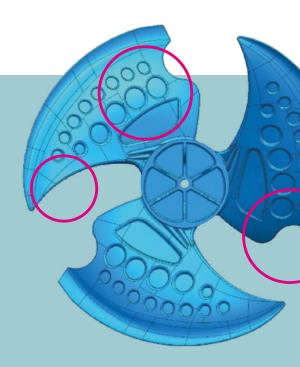

Thanks to the inverter technology, the heat pump adjusts the heating capacity to the demand of a specific system. Modulated heating capacity improves the unit's efficiency and operational comfort.

Thanks to the bionic blade design it is possible to effectively reduce the air flow resistance and lower the noise level. The optimised air duct guarantees a uniform air flow and uses 30% less energy. The concave design of the suction surface reduces the size of the outgoing vortex, and the reduced weight improves performance. The edge notch changes the pressure distribution on its back edge, which in turn results in reduced noise.

Intuitive control

- Multilingual menu
- Modern controller with touch buttons
- Wireless WiFi operation*
- Modbus RTU protocol you can connect up to 16
 devices and integrate them with BMS
- Cascade configuration supports up to 6 units

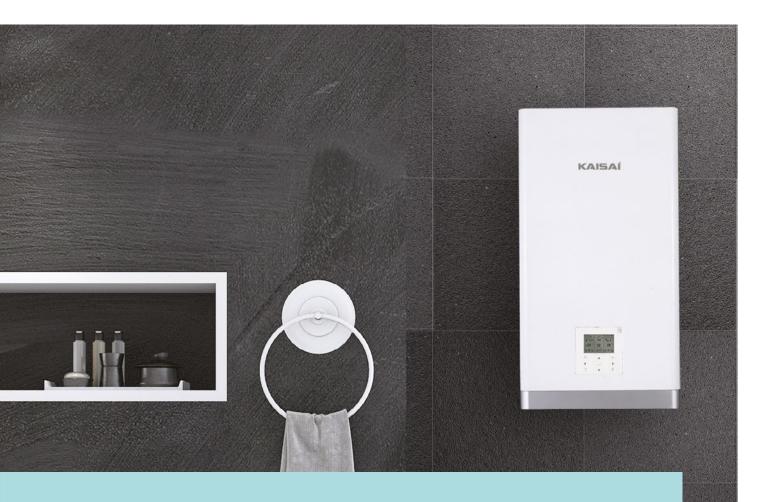

*BETA version of the software may not work on every device. Malfunction of the application does not constitute grounds for a complaint.

CONTROLLER PARAMETERS AND FUNCTIONS

- Simple and quick changing of the heat pump's operating parameters
- Real-time operation parameters monitoring
- Communication cable length up to 50 m
- Built-in temperature sensor
- Possible saving and uploading of settings via USB
- Calendar
- DHW tank disinfection function
- Fast domestic water heating function
- Silent mode, eco mode, parental control, weather-responsive control

2 heating zones

Controlling two heating circuits provides greater flexibility and more accurate temperature control of the low-temperature zone. Operation of additional circulating pump and mixing valve with actuator allows precise control of the temperature of the zone with lower supply temperature e.g. underfloor heating, simultaneously supplying higher temperature to radiators.

A compact design, an independent indoor unit, and a flexible installation make the split type heat pump an ideal choice for owners of houses, shops, offices and retail premises.

All the hydraulic components are easily accessible. The cooling connection between the outdoor and indoor units is resistant to freezing, even during a prolonged power failure, and an additional charge of refrigerant is only required if the length of the cooling lines exceeds 15 m.

SPLIT HEAT PUMPS

Hydraulic module

- All hydraulic components in the outdoor unit, i.e. circulating pump, expansion vessel, safety and air vent valve, flow sensor, pressure gauge and water flow heater, are fitted as standard.
- Built-in controller, possibility to move the wired controller to another location
- Easy installation and simple maintenance

The technical data above is compliant with the guidelines specified in the following standards: EN14511; EN14825; EN50564; EN12102; (EU) No. 811:2013; (EU) No. 813:2013; OJ 2014/C 207/02:2014. The SCOP seasonal heating efficiency was determined for temperate climate conditions.

The sound power level in the heating mode was determined in accordance with EN 12102, under the conditions consistent with EN 14825;

MONOBLOCK heat pumps

KHC-06RY1-B **KHC**-08 | 10 | 12 | 14 | 16RY3-B **KHC**-22 | 30RX3

In the monoblock heat pumps, the refrigerant system is completely integrated within the outdoor unit. First and foremost, such a solution ensures no need to hold special authorisations in terms of cooling systems, space-saving and quiet unit operation.

The special design allows easy access to the internal components, while the length of the communication cable of up to 50 m provides great freedom, in terms of installing the controller.

Outdoor units

- Easy installation and simple maintenance
- All hydraulic components in the outdoor unit: i.a.: circulating pump, expansion vessel, safety and air vent valve, flow sensor, pressure gauge and water flow heater, are fitted as standard.
- The cooling system is fully integrated in the outdoor unit, which means that no additional freon lines are required.
- Compact design, easy to transport and install

Accessories

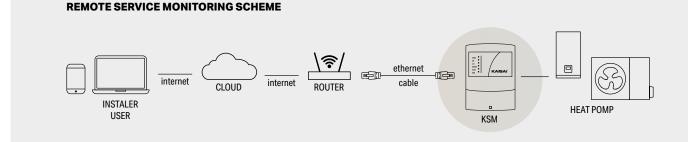

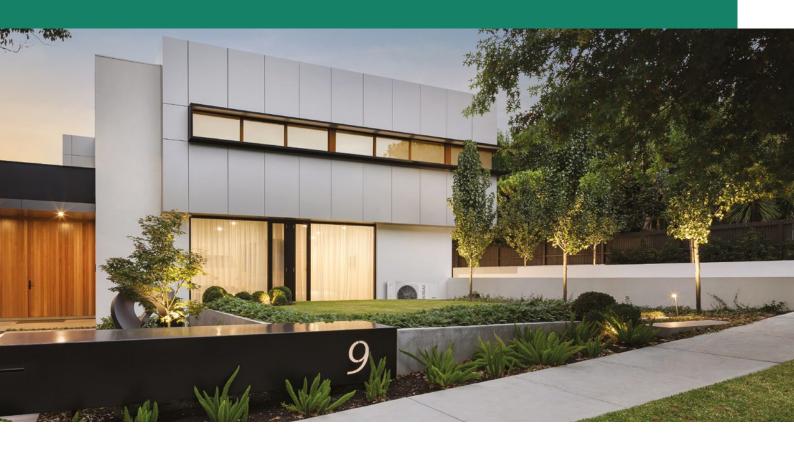

Remote Service Monitoring Module (KSM)

The Kaisai Remote Service Monitoring for heat pumps consists of a KSM module connected to the heat pump and software on a server and enables remote supervision of the unit with monitoring of its operation and quick service response in the event of a fault.

The KSM provides the ability to remotely adjust the heat pump's operating parameters and the sense of security that comes from having constant con-trol over its operation.

ADVANTAGES FOR THE INSTALLER:

- easy access to your own installations
- customer care
- remote problem solving
- minimise the number of field interventions
- reduction of telephone advice
- time saving

ADVANTAGES FOR THE USER:

- application for IOS and Android mobile device
- insight into a wide range of heat pump operation and settings
- constant monitoring of heat pump operation by installation company
- sense of security

The purpose of this document is to provide information and present heat pumps of the Kaisai brand. | Since the technologically advanced production process necessitates its continuous control and improvement, the information contained in this publication may be subject to change. The technical data and prices included in the folder are subject to change. Up-to-date information is always available on **www.kaisai.com**

All technical data is compliant with the guidelines specified in the following standards: EN14511; EN14825; EN50564; EN12102; (EU) No. 811:2013; (EU) No. 813:2013; OJ 2014/C 207/02:2014. The SCOP seasonal heating efficiency was determined for temperate climate conditions. The sound power level in the heating mode was determined in accordance with EN 12102, under the conditions consistent with EN 14825.
